

Perturbation: anti-NMDAR encephalitis

Patient IgG against the GluN1 amino-terminal domain binds surface NMDARs, is bivalently crosslinked, displaces the EphB2-NMDAR interaction (Mikasova 2012), and drives clathrin-mediated endocytosis -> lysosomal degradation (Hughes 2010, Moscato 2014). Net effect: progressive loss of synaptic NMDARs and a fall in Ca2+ influx.
